## What to Expect of an Exascale System

#### Hardware

Projected for 2020-25.

- Compute Nodes: O(100 000)
- CPU Cores/node: O(100)
- Interconnect: > 3 dimensions
- Power: around 30 MW

### Consequences

- High intra-node parallelism
- OS must integrate/abstract new technologies
- High failure rate
- Complex resource management

## A Software Stack for Exascale: Argo

### Project goal

Design and prototype a system software and runtime stack for exascale.

### Project members

D.O.E funded, 3 national labs, 4 universities

- ANL, LLNL, PNNL
- UTK, UIUC, UO, UChicago

About 35 people.

# Argo (2)

### **Argobots**

Modern Runtime for high intra-node parallelism.

- User-level task and threading model
- Interactions with OS and Communication libraries

#### **NodeOS**

Linux with HPC specializations.

- Compute Containers: partitioning instead of isolation/sharing.
- New scheduler and memory subsystems.

# Argo (3)

#### Global Information Bus

High-level components for complex communications requirements.

- Pub-sub system, data aggregation, ...
- Designed with failures and dedicated networks in mind.

#### **GlobalOS**

Distributed management of the entire system.

- Encapsulate configuration and policies inside group of nodes (enclaves).
- Dedicated nodes for system management across the machine.

## NOT in Argo

### Out of scope

- I/O
- MPI (need to be compatible)
- Sysops

### Interaction with other components

- Batch Scheduler
- Power/Boot switches
- Workflows

Swann Perarnau (ANL)

## My Work at Argonne

#### 50 % GlobalOS

Design, prototype, and evaluate the infrastructure to configure, control, and monitor the resources of an exascale machine.

#### 50 % NodeOS

- GlobalOS/NodeOS interactions (containers, resource management),
- Study future memory systems.

### 50 % Integration

Build and maintain our integration platform on top of Chameleon.

## Outline

Introduction

- 2 Chameleon Experiments: Power Management
- Oiscussion

8 / 19

## Plan

Introduction

- 2 Chameleon Experiments: Power Management
- Oiscussion

## Power at Exascale

#### Several Issues

- Limited global power budget,
- Variability in manufacturing process,
- Imbalance in work distribution.

### Our Approach

- Distribute power management across the enclaves hierarchy,
- Use feedback from application/job to balance power/performance,
- As many control levers as possible.

## Global Power Management

#### Role

- Receive global limit from outside sources (sysops),
- Use the enclave hierarchy to recursively distribute power.

#### **Features**

- Use GIB to monitor power consumption across enclaves,
- Can split power between enclaves, and between nodes in an enclave.
- (Future Work) Closed loop: use performance monitoring to help decision.

## Node Power Management

#### Role

- Receive power budget from enclave manager,
- Apply power budget using available levers.

#### **Features**

- Use GIB to monitor power and performance of application.
- Hardware levers: DVFS and RAPL.
- Software levers: can tell the runtime to reduce its core usage.

## Chameleon Experiment

- Control baremetal cluster;
- Install NFS, Job scheduler, system services;
- Partition cluster in two separate jobs;
- Boot on each node our NodeOS;
- Isolate applications from OS noise;
- Launch one MPI application per job, using tasking runtime internally
- Monitor power consumption
- Adjust power dynamically by asking each node to reduce/increase its consumption;
- Upon power budget changes, ask the node runtime to remove/add threads to the application

Video: SC15 Demo

Swann Perarnau (ANL)

## Machine Setup

### Overall design

- Scripts against OpenStack API for node creation, boot.
- Ansible playbooks for NFS, scheduler, system configuration.
- Job scheduler triggers node boot/shutdown dynamically.
- Whole-disk images for NodeOS installation.
- Containers for resource partitioning.
- Custom MPI launcher to spawn into containers directly.

#### Allocation Issues

First version on weeks-long node reservation

- $\rightarrow$  Most compute nodes idle when no job is running.
- Second version using KVM cloud for frontend, NFS, scheduler
- → Dynamic reservations for compute nodes.

## Plan

Introduction

- 2 Chameleon Experiments: Power Management
- Oiscussion

## On Chameleon

### Argo was a challenging user at the beginning

- Missing low-level controls: whole-disk images, boot configuration.
- Week-long allocations of 30+ nodes.
- NTP/DNS access, highly concurrent node creation/deletion.

### We are really happy with it

- Self-managed platform was a nightmare.
- Very responsive and helpful admins.
- Modern hardware, regular software updates.

## Future Chameleon Usage

#### More automation

- Appliances?
- Would really like to do CI/CD on Chameleon...

### What we're still missing

- BIOS reconfiguration
- Deep Memory systems (KNL)
- VPN/direct communication between 3 'sites'
